
Subject: Technical Queries & Requirements for Web/Desktop Application Development

Dear [Developer's Name/Team],

I appreciate your willingness to collaborate on developing a **web/desktop application** that replicates the functionality of the existing mobile application. To ensure a smooth development process, I have outlined some queries and requirements. Please provide detailed responses where applicable.

1. Technology Stack of Existing APK

- What programming language and frameworks were used to build the APK?
- What tools and SDKs were used?
- Does the mobile application rely on any backend services? If yes, what technology is used?
- What database is currently being used?

2. External APIs & Services

- Are there any third-party APIs integrated with the mobile application?
- If yes, please provide documentation and details on how they function.
- Are there any licensing or commercial dependencies associated with these APIs?

3. Device Connectivity Methods

- How does the mobile app connect to the medical device (**USB, Bluetooth Classic, Bluetooth Low Energy (BLE), Wi-Fi, etc.**)?
- Does the device support standard communication methods (REST API, Bluetooth GATT, Serial communication, etc.), or does it use proprietary/custom drivers?
- Are there specific drivers required for USB/Bluetooth connections?
- What are the exact steps for establishing a connection between the device and the application?
- Does the device support **simultaneous multiple connections**?

4. Documentation & Support for Device Integration

- Can you provide documentation about the **device communication protocol** (e.g., command formats, response structures)?
- Are there sample data packets or API specifications available for reference?
- Is there any existing **SDK, library, or wrapper** that we can use to interface with the device?

- If the device requires authentication or encryption, what method is used?

5. Permissions & Security Requirements

- What permissions are required for the mobile app to interact with the device?
- Are there any security measures (authentication, encryption, or digital signatures) implemented?
- Does the device require a unique identifier or token for secure communication?

6. Device Communication Protocol

- What type of requests does the application send to the device?
- What is the data format for communication (**JSON, XML, Binary, or custom protocol**)?
- Are there predefined commands for interacting with the device (e.g., **start test, stop test, fetch data**)?
- Does the device support real-time data streaming?

7. Device Response Handling

- What kind of responses does the device send to the application?
- In which format are these responses received?
- What are the possible error codes or failure scenarios that we need to handle?

8. Application Workflow & Functionality

- What is the step-by-step process within the mobile application?
- How does it process and display data after receiving it from the device?
- Does the application store test results? If yes, where and for how long?
- Are there user roles (e.g., admin, technician) with different levels of access?

9. Data Management & Storage

- Where is test data currently stored in the mobile application (local storage, cloud, and database)?
- Should the system have **data export options** (PDF, CSV, and JSON)?
- Are there **any data retention policies** that must be followed?

10. Compliance & Regulatory Requirements

- Are there any **medical or data compliance standards** (HIPAA, GDPR, FDA, and ISO 13485) that need to be followed?
- Does the device require **regulatory approvals** for integration?
- Is patient data **encrypted or anonymized** in the current system?

11. Additional Considerations for Testing & Deployment

- How can we **test and validate** the device connection during development?
 - Do we need a **simulated environment** for testing without a physical device?
-

Next Steps

Please review the above points and provide responses to each section. Your insights will help us ensure a smooth transition from mobile to web/desktop while maintaining the required functionality.

Looking forward to your response.

Best regards,
